

MONITORFISH

PIONEERING FISH FARM MANAGEMENT

FISH FARMER'S PROBLEM

Fish farming companies on average lose 40% of their revenue because the fish are not kept in optimum growing conditions. Every 7th batch is lost 100% catastrophically.

High stress on fish are mainly caused due to:

- Daily manual handling of fish to estimate fish weight
 - Over/under feeding of fish
 - Cannibalistic nature of fish

MONITORFISH

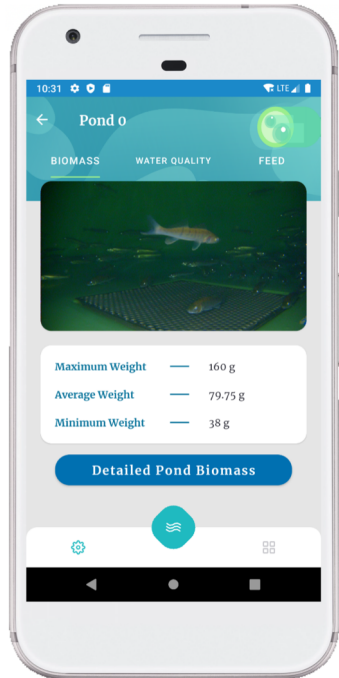

Weighing 50-1000 fish per tank everyday...

OUR SOLUTION: AnFish©

AI-based fish health diagnoses

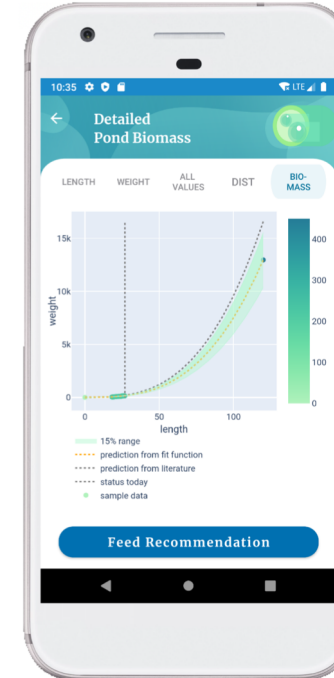

BIOMASS ESTIMATOR

Save time and efforts to measure fish weight. Get live fish weight measurement within seconds

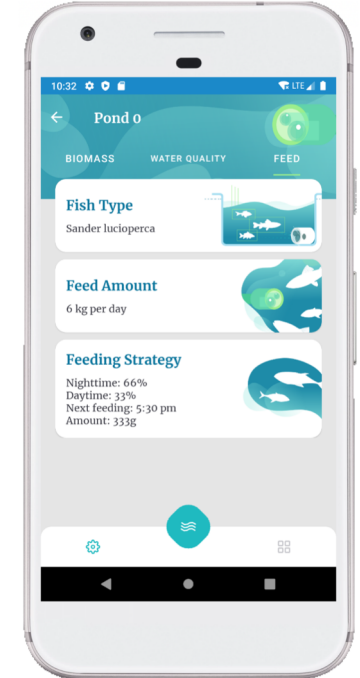

FISH SORTING

Get alerted to sort your fish based on the weight to avoid cannibalism

FISH GROWTH

Understand and take control of the fish production to achieve your target-output

FISH HUNGER

Feed effectively at the right time and in precise quantity to save on feeding costs

Key Steps

01

Installation

02

All Powered Analytics

03

Digital Twin

Installation

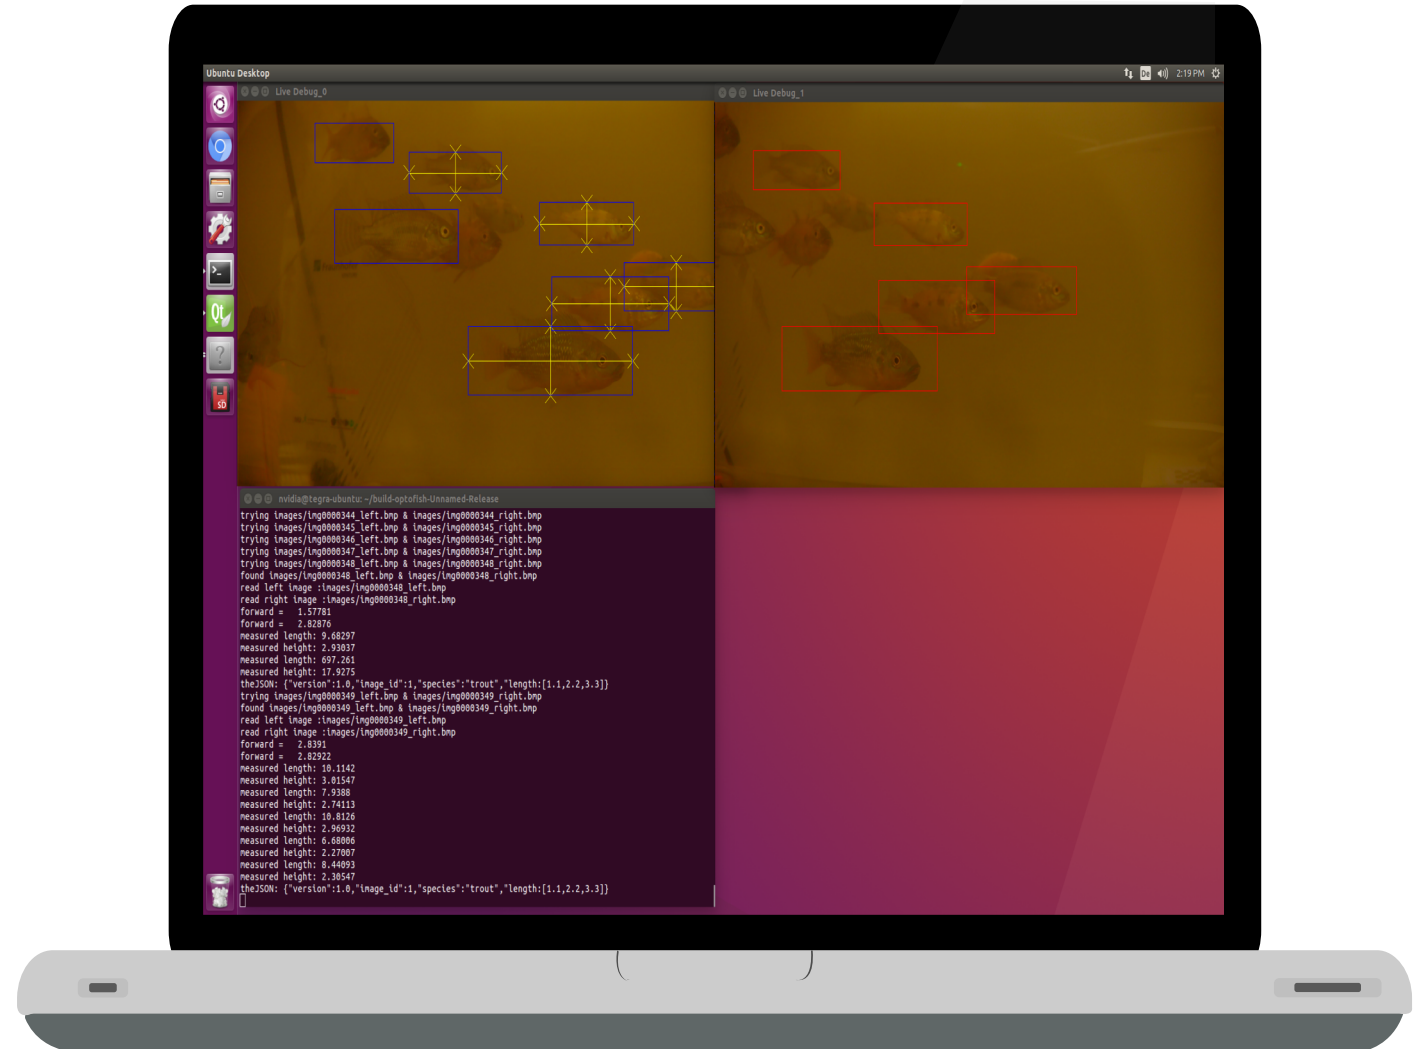

Our proprietary software AnFish© is enabled by a stereo camera system installed within the fish tank along with water quality sensors measuring pH, temperature and dissolved oxygen.

AI Powered Analytics

Our unique data architecture aided by advanced underwater image recognition technology allows automatic simulation of key parameters like fish weight, feeding effectiveness, early signs of stress and water quality.

Digital Twin

We create a digital manual for the fish farm that creates recommended actions on feeding, increasing output, expanding the fish farm, predicting upcoming problems, and predicting overall cost of the fish farm.

PILOT PROJECT

„We can use the images and software to monitor the condition of the scales and the development of the fish - and intervene if something is wrong. That means fewer losses. And the quality of the fish is better when it is less stressed.“

Fish welfare detection parameters

AI-based fish health diagnoses

Measured values:

- Optical parameters:
 - Fish size and weight
 - Movement and patterns of movement
 - Skin properties, colour, infections
 - Behavioural changes e.g. due to stress

Water quality parameters:

- Temperature, pH value, oxygen, ammonium concentration
- Nitrite concentration, turbidity, water level
- Carbon dioxide, redox potential

Validation objectives

AI-based fish health diagnoses

Fish welfare parameters

Biometric feature:

Size, weight, (number) results in population density

Textures and anomalies:

skin characteristics (fins, scales), eyes, gills

Behavioral changes:

Stress-related (physical, chemical, human-related influences; diseases), species-specific stress factors

Movements/deformation:

Global movement (individual movement / swarming movement), local movements (gills, fins)

Validation method

Biometric feature:

Size, weight, (number) results in population density
manual measuring, weighing, counting

You can simply impress your audience and add a unique zing and appeal to your Presentations.

Tissue/blood sample to determine the cortisol/sugar level, eating behaviour
Evaluation by experts (e.g. stocking density)

Tracking and plotting the trajectories, counting the gill movements, escape, hectic; observation of fin movement

Fish activity detection

movement activity = m / day / fish

Task:

- Tracking of all objects (fish)
- Analysis of the image sequence
- Accumulation of relative movement

Technology:

- Recurrent Neural Networks
Combination of RNN and CNN
- feed forward neuron
- recurrent neurons

Spatial differences of all animals of an image capture out of a sequence of two images

One Health

AI-based fish health diagnoses

BioFiA

Bio-indicators for the Evaluation of the Welfare, Health and Product Quality of Fish in different Aquaculture Systems

Location of the BioFiA network partners

- 10 alliance partners
- 5 federal states
- wide use of the BaMS region

Project goals

- Development of molecular and cellular **bio-indicators** and use and evaluation of AI-based **monitoring mechanisms** to assess stress, animal welfare and health in aquaculture facilities and optimize fish production at key stages of animal production
- Based on this contributions are made to:
 - ❑ Stress reduction in machine processing - stress-free harvesting and slaughtering of salmonids to improve fillet quality
 - ❑ Understanding the influence of different microbial communities on nitrification efficiency (in RAS) and on fish
 - ❑ Identification of positive effects of micro-algae feeding on animal health and evaluation of micro-algae as feed additive and as complete feed for fish
- Implementation strategies - **recommended actions** for companies

Working plan

Work package 1: Scientific data acquisition and experimental research

M1.2: Controlled environmental impact of fish farming

Fish production on-farm

RAS-Rearing of young fish

	1		2	
Kontrolle	A	A ₁	D	D ₁
Stressor 2	B	B ₁	E	E ₁
Stressor 3	C	C ₁	F	F ₁

Micro-algae diet

	1		2		3	
Kontrolle	A	A ₁	D	D ₁	G	G ₁
Dosis 1	B	B ₁	E	E ₁	H	H ₁
Dosis 2	C	C ₁	F	F ₁	I	I ₁

M1.5: Non-invasive cloud-based real-time fish monitoring

- Mobile, 24/7, video
- complete physical chemistry,
- Adaptation, validation and further development of the software

M1.6: Parasitological studies of experimental fish

- Parasite detection
- Evaluation of fish farming

CEO & CO-FOUNDER

Chaitanya Dhumasker

M.Sc. Manufacturing engineering
Business administration

Experience

First employee of a water filtration tech startup in Germany. Has led the startup to enter and scale up in the market

CSO & CO-FOUNDER

Dominik Ewald

M.Sc. Biotechnology

Experience

Strong network with agricultural association and aquaculture farmers in Europe

CTO

Jan Apel

B.Sc. Computer science

Experience

10+ years experience in developing software architecture

SENIOR FISH EXPERT

Ralf Fisch

Dipl. in Biology and Bionics

Experience

20+ years experience designing fish farms and improving fish farming output in Europe
